Gary,

As you requested, the attached report shows the Gulfco sample analysis results collected through the end of November 2006 except for the fish analysis, which should be arriving soon. The tables include the Preliminary Screening Values, which are used as benchmarks to determine if additional sampling is necessary to find the extent of contamination. The chemicals that exceeded the screening values are identified in the tables in the report. I should also mention that a screening value exceedence is not an indication of risk. The risk from site contaminants is determined in a Risk Assessment that will be done following the sampling.

Please call or email me if you have any questions on this.

Regards,

Gary Miller
